ABSTRACT

An information terminal that can perform image processing in consonance with the use state and the use purpose. When a retrial module ~~107~~ is started, removal means ~~107a~~ removes part or all of the interpolation processing performed for a Bayer-type module. Thereafter, data obtained by the removal are transmitted to color interpolation means ~~107b~~, another color interpolation process is performed for the data, and the resultant data are transmitted to image quality correction means ~~107c~~. The image quality correction means ~~107c~~ performs another image quality correction process for the data, and transmits the obtained data to JPEG encoding means ~~109~~.
